PRODUCT DOCUMENTATION

Live Try-On: a virtual trial room for online clothes shopping

Prepared by Yashraj · 3 October 2026

1. Summary

Live Try-On lets a customer see themselves wearing any piece of clothing, live on their webcam, before they buy it.

It helps online shops sell more and get fewer returns, and shops pay for it every month. The AI part is rented from a company called Decart, so we do not need to build our own AI to get started.

We will launch it mainly as a Shopify app, with a Chrome extension second, and focus our marketing on well-established clothing and fashion brands, especially foreign brands.

2. What is this product

It is a "virtual trial room" for online shopping. The customer hovers over a product picture, clicks **Try On**, and within a few seconds sees a live video of themselves wearing that item. They can move, turn and switch to another item instantly.

The problem it solves

- People cannot try clothes before buying online, so they hesitate and leave.
- Many buy two sizes or styles and return one, so returns are high and costly.
- Customers spend more time on a shop that is fun and interactive.

Main features

- Works as a Shopify app for shops, and as a Chrome extension on almost any clothing website.
- Shows a Try On button on clothing pictures.
- Shows a live video of the customer wearing the item; switches in one click.
- Stops by itself when not in use, to keep AI costs low.

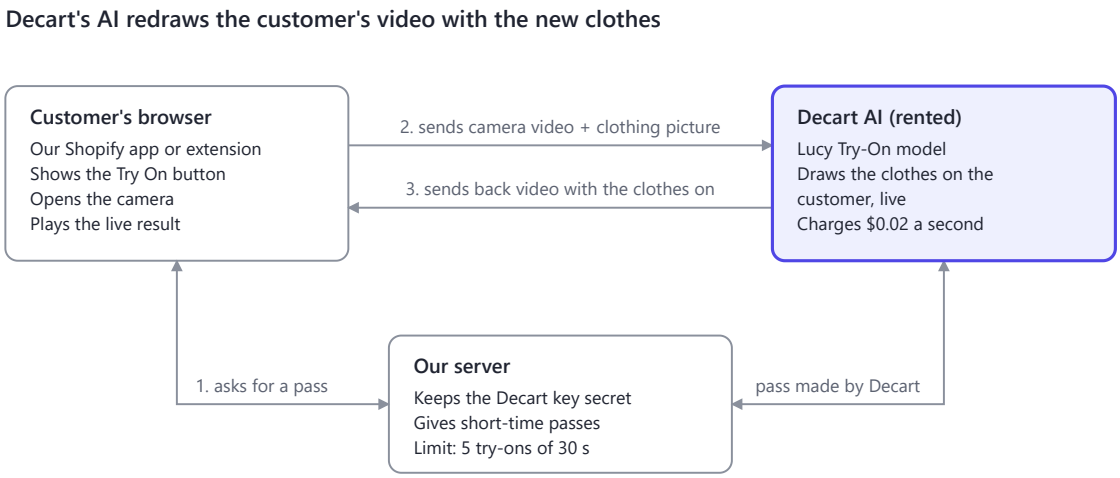

Similar product today: Anywear is a Chrome extension that already does this live try-on. It is made by Decart, the same company whose AI we use.

3. How it works

For the customer it takes three simple steps and a few seconds:

1. Hover over a clothing picture on any shop and click **Try On**.
2. Allow the camera.
3. See yourself wearing the item, live. Click Try On on other items to switch.

Behind the scenes there are three parts:

Our server never handles the video. It only hands out short-time passes, so our secret Decart key stays safe and usage stays within limits.

4. The AI partner: Decart and its charges

Decart charges $0.02 for every second the live try-on video is running, which is about $1.20 per minute. There is no monthly fee and no minimum spend; we pay only for what customers use.

Decart is the company whose AI model (Lucy Virtual Try-On) draws the clothes onto the customer's video. We send it the camera video and the clothing picture; it sends back the video with the clothes on.

What it costs us	US dollars	Indian rupees (approx.)
1 second of live try-on	$0.02	₹1.8
30 seconds (one cloth try-on)	$0.60	₹53
1 minute	$1.20	₹105
5 cloth try-ons (the most one customer can use, 2.5 minutes)	$3.00	₹264
1,000 cloth try-ons, 30 seconds each	$600	₹52,800
"Fast mode" (smoother video)	double	double

Rupee figures use about ₹88 to the dollar. Prices from Decart's pricing page, checked 3 October 2026.

Other points to know

- New Decart accounts get free credits for testing.
- Decart offers lower bulk prices to companies that use it a lot; we should ask for this before launch.
- The AI cost is our biggest cost. Our own server and hosting costs are small next to it.
- The product is designed to save money: each cloth try-on stops by itself after 30 seconds, and each customer can try up to 5 clothes. After that, a safety check blocks more try-ons, so nobody can waste our money. It also stops if the customer leaves the tab.

Cutting this cost in Phase 2: our own AI model

The Decart cost can be cut a lot in Phase 2, when we run our own AI model. We will take an existing image AI model, train it to work like Decart's Lucy, and run it on GPUs (powerful AI computers) that we rent.

	Phase 1: Decart API	Phase 2: our own model
How we pay	$0.02 for every second customers use it	A fixed rent for GPUs that run 24 hours a day, 7 days a week
When nobody is using it	We pay nothing	We still pay the full GPU rent
When many customers use it	Cost goes up with every minute	Cost per minute becomes much lower
Best for	Starting out and winning customers	When we have enough customers to keep the GPUs busy

So in Phase 1 we use the Decart API to win customers with no fixed cost. Once we have enough customers, we build our own model and move to Phase 2 to cut costs.

5. Where we will launch it

We will launch it mainly as a Shopify app, and second as a Chrome extension. Shops pay us, and Shopify has millions of clothing stores, from small shops to big brands. The same try-on engine can later be reused on the other platforms below.

Platform	Who uses it	Who pays us	Store fee	Effort
Shopify app (main launch)	Clothing shops on Shopify	Shops	0% on our first $1 million, then 15%	Small
Chrome extension (second launch)	Customers, on any clothing site	Customers	$5 one-time sign-up	Small
Website widget (copy-paste code)	Any shop with its own website	Shops	None	Small
WooCommerce / other shop plugins	Shops on WordPress and similar	Shops	None or small	Small
In-store smart mirror / kiosk	Physical stores and malls	Stores	None	Medium (needs screen + camera)

Shopify today: the try-on apps on the Shopify App Store are all photo try-on. The customer uploads a photo and gets back a picture of themselves wearing the item. We found no live video try-on app there yet. (Decart's Anywear offers a copy-paste code for Shopify stores, but it is not listed on the Shopify App Store.)

Selling to **shops (B2B)** is the stronger business: one shop brings many customers, and shops can pay from their marketing budget. Selling to **customers (B2C)** is harder because each person would have to pay per minute.

Who we will sell to

Our main marketing focus is well-established clothing and fashion brands, mainly foreign brands. They have a large customer base, so they use many try-ons and buy our bigger plans. They can easily pay these prices when the product brings them more sales and fewer returns, which means a big profit for us.

- **Main focus:** established clothing and fashion brands, especially foreign brands, on the Growth, Business and Enterprise plans.
- **Also welcome:** small Shopify shop owners, on the low-price Starter plan.

6. Pricing structure

Shops pay a monthly plan that includes a set number of try-on minutes, priced at about double our AI cost. This keeps a profit of 40–52% on every plan, even when a shop uses all its minutes.

Plan	Price per month	Try-on minutes	Cloth try-ons (30 s each)	Our AI cost	Our profit
Free trial	$0	2 (one time)	4	$2.40	–$2.40 (to win the shop)
Starter	$149 (≈ ₹13,100)	60	120	$72	$77 (52%)
Growth	$449 (≈ ₹39,500)	200	400	$240	$209 (47%)
Business	$1,199 (≈ ₹1,05,500)	600	1,200	$720	$479 (40%)
Enterprise	Custom	Custom	Custom	Bulk price	Agreed per deal

Starter suits small Shopify shops. Growth, Business and Enterprise suit established and foreign brands, our main focus.

How the plans work

- Extra minutes beyond the plan cost $2.50 each (≈ ₹220); our cost is $1.20.
- The shop decides who can try on (for example, only signed-in customers), so it controls its own spend.
- The shop gets a simple report: number of try-ons, items tried, and add-to-carts after a try-on.

For customers (Chrome extension): a few free tries, then a pack such as 10 minutes (20 cloth try-ons) for $19.99 (our cost $12). This is a side income; shops remain the main market.

Profit goes up further if Decart gives us a bulk discount, if shops do not use all their minutes, and most of all when we move to our own model in Phase 2. Prices can be adjusted after testing with real shops.

7. Benefits and risks

The product is low-cost to run and quick to launch.

Key benefits

- No AI building is needed to start; the AI comes ready from Decart.
- Shops pay monthly, which gives steady income.
- It helps shops sell more and cut returns, which is easy to explain to them.

Risks and how we handle them

Risk	What we do about it
AI cost of $1.20 per minute is high	Auto-stop timers, minute limits in every plan, ask Decart for bulk pricing
Someone misuses it to waste our money	30 seconds per try-on, 5 try-ons per customer, then a safety check blocks more
We depend on one AI company	Keep the AI part separate, and replace Decart with our own model in Phase 2
Result looks wrong on some items	Customer can pick the item type (top, pants, etc.); improve over time
Customer privacy (camera use)	We do not store any video; clear privacy policy before launch
Some shop websites block the camera	An "Open in its own window" option
